Final Project

1. Scope the Project

Our plan is to use a supervised learning technique to predict which customers are most likely to cancel their subscription using **the past three months of customer data which includes subscription and listening history**.

2. Gather Data

Read the following files into Python:

- Customer data: maven_music_customers.csv
- Listing history: maven_music_listening_history.xlsx

```
# Import required libraries
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
# Read in the customer data
df customers = pd.read csv('maven music customers.csv')
# Read in the listening history
df listen history =
pd.read excel('maven music listening history.xlsx', sheet name =
'listening history')
# Read in the audio data
df_audio = pd.read_excel('maven_music_listening_history.xlsx',
sheet_name = 'audio_files')
# Read in the session data
df session = pd.read excel('maven music listening history.xlsx',
sheet name = 'session login time')
df customers.head()

3. Clean Data

a. Convert Data Types

Check the data types of the data in the tables and convert to numeric and datetime values as necessary.

```
# Check the data types
df_customers.dtypes

Customer ID int64
Customer Name object
Email object
```

```
Member Since
                     object

                    Pop Rocks
                                              52
                                 Pop
```

iii. Duplicate Rows

```
# Look for duplicate rows
df_customers.duplicated().sum()

0

df_listen_history.duplicated().sum()

0

df_audio.duplicated().sum()

0

df_session.duplicated().sum()

0
```

iv. Outliers

```
# Look for outliers
```

c. Create New Columns

Create two new columns that will be useful for EDA and modeling:

• Cancelled: whether a customer cancelled or not

• Email: Remove the "Email:" from the email addresses

```
# Create a 'Cancelled' column
df_customers['Cancelled'] = np.where(df_customers['Cancellation
Date'].notna(),1,0)

# Create an updated 'Email' column without the Email: portion
df_customers['Email'] = df_customers['Email'].str[6:]

# Create an updated 'Discount?' column with Yes=1 and No=0
df_customers['Discount?'] = np.where(df_customers['Discount?'] ==
'No', 0, 1)
```

4. EDA

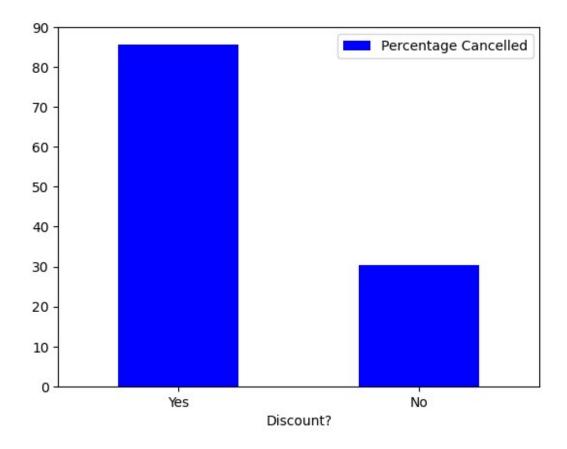

Try to better understand the customers who cancelled:

- How long were they members before they cancelled?
- What percentage of customers who cancelled had a discount vs customers who didn't cancel?

```

Better understand the customers' listening histories:

- Join together the listening history and audio tables
- How many listening sessions did each customer have in the past 3 months?
- What were the most popular genres that customers listened to?

```
# Split the ID in the audio data so the column can be joined with
other tables
temp audio =
pd.DataFrame(df audio.ID.str.split('-').to list()).rename(columns =
{0: 'Type',1: 'New Id'})

5. Prep for Modeling

Create a DataFrame that is ready for modeling with each row representing a customer and the following numeric, non-null columns:

- **Customer ID**
- Whether a customer cancelled or not
- Whether a customer received a discount or not
- The number of listening sessions
- Percent of listening history consisting of Pop
- Percent of listening history consisting of Podcasts

```
# Create a dataframe ready for modeling
model = df_customers[['Customer ID','Cancelled','Discount?']]
model.head()

# Percent podcasts
model['Percent Podcast'] = ((audio final['Comedy'] + audio final['True
Crime'])/audio final.Total)*100
```

Visualize the relationships in the modeling DataFrame using a pair plot:

- What are some of your observations?
- What variables might do a good job predicting customer cancellation?

```
model.corr()
                 Customer ID
